Aphasia
Association

Be in the Know

Only 40% of people in the U.S. have heard of **aphasia** and can correctly identify it as a language disorder that impairs the ability to communicate.

More than 2 million people in the U.S. are estimated to have aphasia, commonly as a result of stroke. Stroke survivors with aphasia face an increased incidence of post-stroke depression versus stroke survivors with no aphasia.

Aphasia impacts language: listening, writing, reading and speaking

Aphasia does NOT impact intelligence

Tips for better communication with someone with aphasia:

Be patient. Allow extra time to communicate and keep it simple.

Use a variety of ways to communicate — writing, facial expressions, speaking, pictures, phone/communication apps.

Successful communication takes two — be direct and confirm what's said.
